

# MODULAR ELECTRICAL SYSTEMS

Modular electrical systems include components that can be plugged together on-site, creating a system of connections that are reconfigurable and flexible for any open plan or workplace environment. These systems provide a point of electrical connection for duplex receptacles, flexible panel connectors, and power entry components. Oftentimes they consist of four major components: a distribution harness, jumper, power entry, and receptacle(s). It is important to note, that some Dekko power products must be hardwired to the building, while others can be plugged directly into a receptacle.
